# MA10VO/VSO Series 31

## Features

Axial piston pump MA10VO is a swashplate design and is used in open loop circuits. Flow is proportional to drive speed and displacement. By adjusting the position of the swashplate, it is possible to smoothly vary the output flow of the pump.

- Flange connections available in SAE or Metric
- Two case drain ports
- Operating pressure of 4000 psi (280 bar)
- Good suction characteristics
- Low noise level
- High power/weight ratio
- Long service life
- Quick response times
- Axial and radial loading of drive shaft is possible
- Wide range of controls
- Through-drive options available for multi-circuit systems

# MA10VO/VSO Series 31

## Technical Data

- Input operating pressure range  
Absolute pressure at port S (A)  
P<sub>abs</sub> min.....11.6 psi (0.8 bar)  
P<sub>abs</sub> max.....435 psi (30 bar)
- Output operating pressure range  
Pressure at port B  
Nominal pressure P<sub>N</sub>.....4000 psi (280 bar)  
Peak pressure P<sub>max</sub>.....5070 psi (350 bar)
- Case drain pressure  
Maximum pressure of leakage fluid (at ports L, L1 is 7 psi (0.5 bar) higher than input pressure at port S, but not higher than 30 psi (2 bar) absolute.
- Direction of flow  
("S" inlet port to "B" pressure port)
- Table of values (theoretical values, without considering  $\eta_{mh}$  and  $\eta_v$ ; values rounded)

Size		18	28	45	71	100	140
<b>Displacement</b>	V <sub>gmax</sub> cm <sup>3</sup> /rev (in <sup>3</sup> /rev)	18 (1.10)	28 (1.71)	45 (2.75)	71 (4.33)	100 (6.10)	140 (8.54)
<b>Max. Speed</b>	N <sub>omax</sub> rpm	3300	3000	2600	2200	2000	1800

<b>Max. Torque</b> $\Delta p = 4000$ psi (280 bar)	T <sub>max</sub> Nm (ft-lb)	80 (58)	125 (91)	200 (146)	316 (230)	445 (324)	623 (453)
<b>Weight (w/o fluid)</b>	Kg (lbs)	12 (27)	15 (33)	21 (46)	33 (73)	45 (99)	60 (132)

Note: Values shown are valid for an absolute pressure of 1 bar at suction port. If the flow is reduced or if the inlet pressure is increased, the speed may be increased.

### 6. Determination of size

$$\text{Flow } q_v = \frac{V_g \cdot n \cdot \eta_v}{231} \quad [\text{gpm}] \quad \left( q_v = \frac{V_g \cdot n \cdot \eta_v}{1000} \quad [\text{L/min}] \right)$$

$$\text{Torque } T = \frac{V_g \cdot \Delta p}{24 \cdot \pi \cdot \eta_{mh}} \quad [\text{lb-ft}] \quad \left( T = \frac{V_g \cdot \Delta p}{20 \cdot \pi \cdot \eta_{mh}} \quad [\text{Nm}] \right)$$

$$\text{Power } P = \frac{q_v \cdot \Delta p}{1714 \cdot \eta_t} \quad [\text{HP}] \quad \left( P = \frac{q_v \cdot \Delta p}{600 \cdot \eta_t} \quad [\text{kW}] \right)$$

$V_g$  = Displacement per revolution in in<sup>3</sup> (cm<sup>3</sup>)  
 $\Delta p$  = Differential pressure in psi (bar)  
 $n$  = Speed in rpm (min<sup>-1</sup>)  
 $\eta_v$  = Volumetric efficiency  
 $\eta_{mh}$  = Mechanical-hydraulic efficiency  
 $\eta_t$  = Total efficiency

## Fluid

1. Hydraulic fluid

The MA10V open loop pump in the standard design should be used with a good quality, petroleum based anti-wear hydraulic fluid.

2. Operating viscosity range

$V_{opt} = 16 \text{ mm}^2 / \text{s} \sim 36 \text{ mm}^2 / \text{s}$  (80-170 sus)

For optimum efficiency and service life we recommend that the operating viscosity (at operating temperature) be selected from within the range:

$V_{opt} = \text{opt. operating viscosity } 16 \sim 36 \text{ mm}^2 / \text{s}$

Referred to tank temperature (open loop circuit).

Limits of viscosity range

(The following values are valid for extreme operating conditions):

$V_{min} = 10 \text{ mm}^2 / \text{s}$  (60 sus)

For short periods ( $t \leq 1$  minute) at max. leakage oil temperature of  $80^\circ\text{C}$  ( $176^\circ\text{F}$ )

$V_{max} = 1000 \text{ mm}^2 / \text{s}$

For short periods upon cold start

3. Temperature range

$T_{min} = -20^\circ\text{C}$  ( $-13^\circ\text{F}$ );  $T_{max} = +80^\circ\text{C}$  ( $+176^\circ\text{F}$ )

4. Filtration

In order to ensure reliable operation of the axial piston unit, the operating fluid must be maintained to a cleanliness ISO class of at least 16/19 to ISO4406. This may be achieved with filter elements with a cleanliness code of  $10\mu\text{m}$ .

### Installation Note

The pump housing must be filled with clean hydraulic fluid prior to pump start up and remain full during operation.

The concentricity between the prime mover drive shaft and the pump shaft must be less than 0.05 mm (0.002 in).

# MA10V0/VSO Series 31

## Pump Installation Notes

The installation position of the pump is optional.

The pump housing must be filled with fluid both when commissioning and in operation. In order to achieve low noise levels, all connecting lines (inlet, case drain) should be isolated from the tank by flexible lines.

### Vertical Installation (Shaft end upwards)

The following conditions should be noted:

- Before installing the pump inside a tank, fill the pump case with fluid
- Make sure the ports are below the oil level (L), (L1) & S
- Avoid mounting above the tank whenever possible in order to maintain a low noise level
- The permissible inlet height is a result of the overall pressure loss "A" may not be greater than 32 inches (800 mm)

### Horizontal Installation

The following conditions should be noted:

- The pump must be installed in such a manner, that either (L) or (L1) (case drain) is at the top
- If the minimum fluid level is below the ports of the pump, pipe the ports (L) or (L1) & S below the minimum oil level
- Avoid mounting above the tank whenever possible in order to maintain a low noise level
- The permissible inlet height (h) is a result of the overall pressure loss, "A" may not be greater than 32 inches (800 mm)

### Horizontal Installation (Below the reservoir tank)

- Pipe (L), (L1) and S must be mounted below the oil level

# MA10VO/VSO Series 31

## DR Pressure Control

The pressure control serves to maintain a constant pressure in the hydraulic system within the control range of the pump. The pump therefore supplies only the amount of hydraulic fluid required by the actuators. Pressure may be smoothly set at the pilot valve.

## DRG Pressure Control, Remote Control

A pressure relief valve may be externally piped to port X for remote control purposes. It is not, however, included with the DRG control.

The differential pressure at the pilot valve is set as standard to 20 bar (290 psi) and this results in a pilot flow of 1.5 L/min (0.4 gpm). If another setting is required (in the range 10-22 bar), please indicate that specifically and clearly.

The remote pilot valve should be mounted no more than 78in (2 meters) from the pump.

## DFR/DFR1 Pressure/Flow Control

In addition to the pressure control function, the pump flow may be varied by means of a differential pressure at the actuator (e.g. an orifice).

In model DFR1, the X orifice is plugged.

### Combination Pumps

By mounting combination pumps, circuits independent of each other are available for use.

- If the combination pump consists of 2 MA10VO pumps and if these are to be delivered ready-assembled, then the two type codes are to be combined with a "+", when ordering.

**Ordering example: MA10VO71DR/31R-PSC62K02 + MA10VO28DR/31R-PSC62N00**

- If a gear pump, vane or other type pump is to be mounted in the factory as a second or third pump, please consult the factory for available mounting information.
- If the second pump is an MA10V unit, the spigot will be to SAE dimensions.

# MA10VO/VSO Series 31 Through Drives

## Maximum Permissible Input and Through Drive Torques

### Through-drive

The MA10VO axial piston pump can be supplied with a through-drive.

The type of through-drive is determined by codes (K01-K17). If the combination pump is not mounted in the factory, the simple type code is sufficient.

Included with the pump unit are: Coupling sleeve, seals and necessary hardware.

The drive torques for pump 1 and pump 2 can be split up as required. However, the max. permissible input torque  $T_{tot}$  as well as the max. permissible through drive torque  $T_{thr}$  may not be exceeded.

## Features

Axial piston pump MA10VO is a swashplate design and is used in open loop circuits. Flow is proportional to drive speed and displacement. By adjusting the position of the swashplate, it is possible to smoothly vary the output flow of the pump.

- Flange connections available in SAE or Metric
- Two case drain ports
- Operating pressure of 3625 psi (250 bar)
- Good suction characteristics
- Low noise level
- High power/weight ratio
- Long service life
- Quick response times
- Axial and radial loading of drive shaft is possible
- Wide range of controls
- Through-drive options available for multi-circuit systems

## Fluid

1. Hydraulic fluid

The MA10V open loop pump in the standard design should be used with a good quality, petroleum based anti-wear hydraulic fluid.

2. Operating viscosity range

$V_{opt} = 16 \text{ mm}^2 / \text{s} \sim 36 \text{ mm}^2 / \text{s}$  (80-170 sus)

For optimum efficiency and service life we recommend that the operating viscosity (at operating temperature) be selected from within the range:

$V_{opt} = \text{opt. operating viscosity } 16 \sim 36 \text{ mm}^2 / \text{s}$

Referred to tank temperature (open loop circuit).

Limits of viscosity range

(The following values are valid for extreme operating conditions):

$V_{min} = 10 \text{ mm}^2 / \text{s}$  (60 sus)

For short periods ( $t \leq 1$  minute) at max. leakage oil temperature of  $80^\circ\text{C}$  ( $176^\circ\text{F}$ )

$V_{max} = 1000 \text{ mm}^2 / \text{s}$

For short periods upon cold start

3. Temperature range

$T_{min} = -20^\circ\text{C}$  ( $-13^\circ\text{F}$ );  $T_{max} = +80^\circ\text{C}$  ( $+176^\circ\text{F}$ )

4. Filtration

In order to ensure reliable operation of the axial piston unit, the operating fluid must be maintained to a cleanliness ISO class of at least 16/19 to ISO4406. This may be achieved with filter elements with a cleanliness code of  $10\mu\text{m}$ .

### Installation Note

The pump housing must be filled with clean hydraulic fluid prior to pump start up and remain full during operation.

The concentricity between the prime mover drive shaft and the pump shaft must be less than 0.05 mm (0.002 in).

# MA10V0/VSO Series 52

## Pump Installation Notes

The installation position of the pump is optional.

The pump housing must be filled with fluid both when commissioning and in operation. In order to achieve low noise levels, all connecting lines (inlet, case drain) should be isolated from the tank by flexible lines.

### Vertical Installation (Shaft end upwards)

The following conditions should be noted:

- Before installing the pump inside a tank, fill the pump case with fluid
- Make sure the ports are below the oil level (L), (L1) & S
- Avoid mounting above the tank whenever possible in order to maintain a low noise level
- The permissible inlet height is a result of the overall pressure loss "A" may not be greater than 32 inches (800 mm)

### Horizontal Installation

The following conditions should be noted:

- The pump must be installed in such a manner, that either (L) or (L1) (case drain) is at the top
- If the minimum fluid level is below the ports of the pump, pipe the ports (L) or (L1) & S below the minimum oil level
- Avoid mounting above the tank whenever possible in order to maintain a low noise level
- The permissible inlet height (h) is a result of the overall pressure loss, "A" may not be greater than 32 inches (800 mm)

### Horizontal Installation (Below the reservoir tank)

- Pipe (L), (L1) and S must be mounted below the oil level

## DR Pressure Control

The pressure control serves to maintain a constant pressure in the hydraulic system within the control range of the pump. The pump therefore supplies only the amount of hydraulic fluid required by the actuators. Pressure may be smoothly set at the pilot valve.

Static characteristic

## DRG Pressure Control, Remote Control

A pressure relief valve may be externally piped to port X for remote control purposes. It is not, however, included with the DRG control.

The differential pressure at the pilot valve is set as standard to 20 bar (290 psi) and this results in a pilot flow of 1.5 L/min (0.4 gpm). If another setting is required (in the range 10-22 bar), please indicate that specifically and clearly.

The remote pilot valve should be mounted no more than 78in (2 meters) from the pump.

# MA10V0/VSO Series 52

## DFR/DFR1 Pressure/Flow Control

In addition to the pressure control function, the pump flow may be varied by means of a differential pressure at the actuator (e.g. an orifice).

In model DFR1, the X orifice is plugged.

Static characteristic  
(at  $n_1 = 1500 \text{ rpm}$ ; oil temp. =  $125^\circ\text{F} / 51^\circ\text{C}$ )

B	Pressure Port
S	Suction Port
L, L1	Case Drain Ports (L1 sealed)
X	Pilot Pressure Port

## Flow Control/Differential Pressure $\Delta p$

Adjustable between 10 and 22 bar (higher values on request).

Standard setting: 14 bar. If a different setting is required, please specify clearly.

When port X is unloaded to tank, a zero stroke pressure ('stand by') of  $p = 18 \pm 2 \text{ bar}$  ( $260 \pm 30 \text{ psi}$ ) results.

## Control Data

For pressure control technical data see DR pressure control.
